LUONG, DZU D	

ART UNIT	PAPER NUMBER
2871	

MAIL DATE	DELIVERY MODE
01/04/2008	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)	
	10/549,810	IOKI ET AL.	
	Examiner	Art Unit	
	Dzu Luong	2871	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *19 September 2005*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-13* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-13* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on *19 September 2005* is/are: a)☒ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☒ All b)☐ Some * c)☐ None of:

1.☒ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☒ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date *12/20/2005, 09/19/2005*.
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____.

DETAILED ACTION

Priority

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which paper has been placed of record in the file.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

2. Claims **1** and **13** are rejected under 35 U.S.C. 103(a) as being unpatentable over Sato et al. (WO 01/59508 A1, using US 6,864,862 B2 as the US equivalent document), in view of Yoo et al. (US 2004/0130884 A1), and further in view of Holman et al. (US 6,871,982 B2).

Regarding Claim 1:

Sato et al. discloses *an image display system* (`liquid crystal display unit 10a`. See at least to Figs. 9A, 9B, 10, 11A, 11B) *comprising:*

- *a liquid crystal display panel* (liquid crystal panel 20) *which can transmit light irradiated from behind;*
- *a light source* (backlight 13) *for irradiating*
  - *a light having a specific polarization* (right-eye polarizing filter 14a) *and*
  - *a light having a polarization axis orthogonal to the specific polarization* (left-eye polarizing filter 14b) *onto the liquid crystal display panel,*
  - *a filter* (polarizing filter 21a. See Fig. 10) *disposed between the liquid crystal display panel and the light source and comprises*
    * *first areas* (21a) *for transmitting the light having the specific polarization and*
    * *second areas* (22a) *for transmitting the light having the polarization axis orthogonal to the specific polarization disposed repeatedly in the vertical direction;*
- *the light source comprising*

- *a light emitting source* (backlight 13) *for emitting light which has no specific polarization,*

- *polarizing means* (right- and left-eye polarizing filters 14a and 14b) *for turning* (The right- and left-eye polarizing filters 14a and 14b are configured to linearly polarize the light in polarizing directions orthogonal to each other. See column 1, lines 65-67)

  * *the light which has no specific polarization into the forms of the light having the specific polarization and*

  * *the light having the polarization in which the polarization axis is orthogonal to the polarization axis of the specific polarization to output the lights,*

- *optical means* (Fresnel lens 11. See Figs 9A-B) *for*

  * *refracting the lights having the different polarizations into the directions toward the left and right eyes respectively and*

  * *irradiating the same onto the liquid crystal display panel.*

Sato et al. fails to disclose *the light-emitting source is a linear light-emitting source.* However, Yoo et al. discloses a liquid crystal display device using a backlight unit, wherein the backlight unit of a display device employing DDAM (Divided Display Area Method) in which a display area is divided into a plurality of regions for operation, among Field Sequential (FS) driving methods. In addition, a backlight unit for a display device includes a plurality of light source parts (Applicant's *linear light-emitting source*) arranged at a predetermined interval at both sides of the auxiliary light guide plate (See paragraph 3; paragraph 78; paragraph 80, lines 10-11; and at least Figs. 9 and 11 of Yoo et al.). Therefore, it would have been at least obvious to one of ordinary skill in the art to employ the a plurality of light source parts as a *linear light-emitting source* for the entire driving regions and thereby the backlight unit is configured to light once every backlight source for one frame (See paragraph 59, lines 7-9) . As a result, Sato et al. as modified by Yoo et al. discloses

- *characterized-in that the light-emitting source is a linear light-emitting source* (LED lamps mounted on the PCB substrate 94 or 116 of Yoo et al.) *which is disposed in the*

lateral direction with respect to the liquid crystal display panel so that

* *a light source member* (polarizing filter 22a of Sato et al.) *for displaying three-dimensional images comes to the center portion and*

* *light source members* (polarizing filter 21a and halfwave plates 26 of Sato et al.) *for enlarging viewing angle come to both sides*

for achieving a similar characteristics such as enhancing the display performance (See paragraph 78, lines 6-7 of Yoo et al.).

Sato et al. as modified by Yoo et al. fails to disclose *the linear light-emitting source* comprises *center prisms* and *peripheral prisms.*

Holman et al. discloses an illumination system (Applicant's *linear light-emitting source*) wherein light-recycling reflectors for collecting and reusing light emitted by a planar LED light source (See at least column 4, lines 34-35; and Figs. 15A-28E) for achieving the highest possible concentrations of output lumens per square millimeter of output aperture (See column 4, lines 34-35; and column 11, lines 36-38 of Holman et al.,

respectively). Therefore, it would have been at least obvious to one of ordinary skill in the art to employ the light-recycling reflectors as

* *center prisms which increase brightness by narrowing the irradiating range of the linear light-emitting source at the center portion of the linear light-emitting source*

for achieving similar advantages such as the highest possible concentrations of output lumens per square millimeter of output aperture. (See column 11, lines 36-38 of Holman et al.).

Furthermore, according to field sequential (FS) driving methods as discussed above, Sato et al. in view of Holman et al. and further in view of Yoo et al. discloses

* *peripheral prisms having a different brightness from the center prisms disposed at both ends of the linear light-emitting source.*

Thereby enhancing the display performance (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claims 2:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an*

image display system according to claim 1, characterized in that the linear light-emitting source includes linearly disposed plurality of point light-emitting sources (LED), *and the center prisms and the peripheral prisms* (See at least Figs. 15A-28E of Holman et al.) *each includes*

- *a light-inputting surface* (hemispherical mirror 332) *which allows light from the point light-emitting sources to enter and*
- *a light-outputting surface* (condensing lens 308) *which outputs light entered from the light-inputting surface and then corrected in the optical path, which are disposed in one-to-one relation with respect to the respective point light-emitting sources.*

Doing so, for achieving light-recycling reflectors (Applicant's *center prisms* and *peripheral prisms*) for collecting and reusing light emitted by a planar LED light source, and thereby the highest possible concentrations of output lumens per square millimeter of output aperture can be obtained (See column 4, lines 34-35; and column 11, lines 36-38 of Holman et al., respectively).

Regarding Claims 3:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 2, characterized in that the light-outputting surfaces of the center prisms and the peripheral prisms are arranged without gap therebetween* (See Fig. 31B of Holman et al.).

Doing so, for achieving light-recycling reflectors (Applicant's *center prisms* and *peripheral prisms*) for collecting and reusing light emitted by a planar LED light source, and thereby the highest possible concentrations of output lumens per square millimeter of output aperture can be obtained (See column 4, lines 34-35; and column 11, lines 36-38 of Holman et al., respectively).

Regarding Claims 4:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 2, characterized in that the center prisms and the peripheral prisms are disposed in one-to-one relation with respect to the respective point light-emitting sources* (See at least Figs. 15B, 28B of Holman et al.).

Doing so, for achieving light-recycling reflectors (Applicant's *center prisms* and *peripheral prisms*) for collecting and reusing light emitted by a planar LED light source, and thereby the highest possible concentrations of output lumens per square millimeter of output aperture can be obtained (See column 4, lines 34-35; and column 11, lines 36-38 of Holman et al., respectively).

Regarding Claims 5:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 2, characterized in that the center prisms and the peripheral prisms are provided separately for*

- *the center portion of the linear light-emitting source and*
- *the both ends of the liner light-emitting source,*

and formed integrally via the peripheral portions of the light-outputting surfaces corresponding to the predetermined-number of point light-emitting sources (See at least Figs. 9 and 11 of Yoo et al.).

Thereby enhancing the display performance (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claims 6:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to any one of claim 2 to claim 5,* In accordance with another aspect of Yoo et al.'s invention, the backlight unit including: upper (Applicant's *center portion*) and lower (Applicant's *end portions*) light guide plates each divided into first to n-th regions for a field sequential driving; a plurality of light sources arranged in a zigzag configuration (*high density* or *low density*) at sides of the first to n-th regions of the upper and lower light guide plates (See at least to paragraph 87, lines 1-8; and Fig. 11). Accordingly,

characterized in that the point light-emitting sources are arranged

- *at high density at the center portion of the linear light-emitting source and*
- *at low density at both end portions of the linear light-emitting source*

can be obtained. Thereby enhancing the display performance (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claims 7:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to any one of claim 1 to claim 5, characterized in that the center prisms and the peripheral prisms include wedge shaped prisms* (See at least Figs. 15A-28E of Holman et al.) *each having*

- *a light-inputting surface facing the point light-emitting sources and*
- *a light-outputting surface facing the liquid crystal display panel surface, and*
- *at least one of the opposing side surfaces of the wedge shaped prism with respect to the liquid crystal display panel is formed into-a curved surface.*

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claims 8:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 6, characterized in that the*

center prisms and the peripheral prisms include wedge shape prisms (See at least Figs. 15A-28E of Holman et al.) *each having*

- *light-inputting surface facing the point light-emitting sources and*
- *a light-outputting surface facing the liquid crystal display panel surface, and*
- *at least one of the opposing side surfaces of the wedge shaped prism with respect to the liquid crystal display panel is formed into a curved surface.*

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claim 9:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 7, characterized in that the other opposing side surface of the wedge shaped prism is formed into a flat plane* (See at least Figs. 15A-28E of Holman et al.).

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claim 10:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 8, characterized in that the other opposing side surface of the wedge shaped prism is formed into a flat plane* (See at least Figs. 15A-28E of Holman et al.).

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claim 11:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to any one of claim 1 to claim 5, characterized in that the light-outputting surfaces of the center prisms and the light-outputting surfaces of the peripheral prisms are positioned at substantially a uniform distance to the center portion of the liquid crystal display panel* (See at least Figs. 15B, 15D, 28B, 28C of Holman et al.).

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claim 12:

Sato et al. as modified by Yoo et al., and Holman et al. discloses *an image display system according to claim 6, characterized in that the light-outputting surfaces of the center prisms and the peripheral prisms are positioned at substantially a uniform distance toward the center of the liquid crystal display panel* (See at least Figs. 15B, 15D, 28B, 28C of Holman et al.).

Thereby `enhancing the display performance` (See paragraph 78, lines 6-7 of Yoo et al.).

Regarding Claim 13:

Sato et al. discloses *a light source unit* (`liquid crystal display unit 10a. See at least to Figs. 9A, 9B, 10, 11A, 11B`) *comprising*

- *a light source member*(`polarizing filter 22a` of Sato et al.) *for observation from the front at a center portion and*
- *light source members* (`polarizing filter 21a and halfwave plates 26` of Sato et al.) *for enlarging the viewing angle at both end portions for emitting light linearly and irradiating on a liquid*

crystal display panel from behind via optical means (Fresnel lens 11. See Figs 9A-B) *which refracts and irradiates light onto the liquid crystal display panel.*

Sato et al. fails to disclose *the light source unit* comprises *center prisms* and *peripheral prisms.*

Holman et al. discloses an illumination system (Applicant's *linear light-emitting source*) wherein light-recycling reflectors for collecting and reusing light emitted by a planar LED light source (See at least column 4, lines 34-35; and Figs. 15A-28E) for achieving the highest possible concentrations of output lumens per square millimeter of output aperture (See column 4, lines 34-35; and column 11, lines 36-38 of Holman et al., respectively). Therefore, it would have been at least obvious to one of ordinary skill in the art to employ the light-recycling reflectors into *the light source unit* for achieving advantages such as the highest possible concentrations of output lumens per square millimeter of output aperture. (See column 11, lines 36-38 of Holman et al.). In other words,

configured in such a manner that

- *the center prisms for narrowing an irradiating range of the linear light-emitting source to increase the brightness are disposed at the center portion of the linear light-emitting source*

can be obtained for achieving similar advantages.

Sato et al. as modified by Holman et al. fails to disclose *peripheral prisms having a brightness different from the center prisms.* However, Yoo et al. discloses a liquid crystal display device using a backlight unit, wherein the backlight unit of a display device employing DDAM (Divided Display Area Method) in which a display area is divided into a plurality of regions for operation, among Field Sequential (FS) driving methods (See paragraph 3; paragraph 78; and at least Figs. 9 and 11 of Yoo et al.). Therefore, it would have been at least obvious to one of ordinary skill in the art to constitute *a light source unit*, wherein

- *peripheral prisms having a brightness different from the center prisms are disposed on both end portions of the linear light-emitting source*

for achieving advantages such as enhancing the display performance (See paragraph 78, lines 6-7 of Yoo et al.).

Conclusion

The prior arts made of record and not relied upon is considered pertinent to applicant's disclosure:

1. Akira Yamaguchi (US 2001/0019378 A1) discloses a LCD device having a collimating plate to improve viewing angles in the liquid crystal display.

2. Sato et al. (US 6,801,263 B2) discloses liquid crystal display apparatus including a position control unit for processing and comparing the volumes of the light by the light receiving devices to control the position of the back light in the left-and-right direction.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dzu Luong whose telephone number is 571-270-3102. The examiner can normally be reached on Monday-Friday 8:00 AM - 5:00 PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, DAVID NELMS can be reached on 571-272-1787. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
